Warehouse Management:

Technology for

Education

A warehouse management system (WMS) is a key part of the supply chain and primarily aims to control the movement and storage of materials within a warehouse and process the associated transactions, including shipping, receiving, putaway and picking. The systems also direct and optimize stock putaway based on real-time information about the status of bin utilization. A WMS monitors the progress of products through the warehouse. It involves the physical warehouse infrastructure, tracking systems, and communication between product stations.

- Business Intelligence.
- Integrated EDI system.
- Automated Tracking System.
- Enterprise Mobility.
- Document Automation.
